UI/UX
LAB ASSIGNMENT - 06

Aim: To study usability testing of a figma prototype using a remote testing tool (Maze).

Problem statement: Study how the tool maze can be used for un-moderated remote user testing of a website design created in figma.

Theory: Maze is a remote usability testing platform that allows designers to test clickable figma prototypes with real users without coding. The prototype is imported using share a link, and participants complete tasks independently. Maze records user behaviour and generate reports.

Features:- 1) Direct import of figma prototype.
2) Create missions and follow-up questions
3) Heatmaps to track user clicks.
4) Generate and export test reports.

Applications:- 1) Compare design using A/B testing
2) Identify confusing elements
3) Analyze clicks and misclicks
4) Understand user behaviour

Date :
Page No.

Conclusion: Maze helps test Figma prototypes, identify usability issues and improve user experience before mobile development.

FAQs:

1) Define objective of user testing.
To evaluate how easily users interact with a design, identify usability problems and improve the overall user experience.

2) Discuss different methods of user testing
- Moderated Testing: A facilitator guides the user during testing.
- Unmoderated Testing: Users complete tasks independently.
- Remote testing: Testing is conducted online.
- A/B testing: Two designs are compared to find the better one.
- In-person testing: Users test design face to face.

3) Explain features and benefits of maze.
Features - • import Figma prototypes directly.
• generates automatic reports
• Provides heatmaps and usability metric.
Benefits - • saves time and effort.
• identifies usability issues
• understand user behaviour.
