UI/UX
LAB ASSIGNMENT - 07

Aim: To redesign the interface of the project developed in previous lab assignments for users with special needs and to create an accesible and inclusive interactive prototype.

Problem statement: In the previous assignments you designed an application for general population and created its wireframes, screens and prototypes in figma. In this assignment, use the same project and same figma file and redesign it for a group of users with special needs. Identify the needs of chosen user group, modify your existing screens and prototype to meet those needs by applying accessibility guidelines and check your final design with checklist.

Theory: Special needs design aims to make product usable for people with different abilities and limitations including permanent, temporary and situational disabilities.

Type of special needs -
visual, hearing, motor, cognitive

important design guidelines :
- use high color contrast and readable text

Date:
Page No.

- Keep layout simple and consistent.
- Provide large buttons and clear labels.
- Display clear feedback and error messages.

Steps:
- Select a special-needs user group.
- Create a persona.
- Redesign 3-4 screens in Figma.
- Create an interactive prototype.
- Test with atleast two users.

Tools: Figma and webaim contrast checker.

Deliverable: Figma prototype link.

Conclusion: Special needs design helps create accessible, user-friendly interfaces that meet the needs of people with different abilities and improve the overall user experience.

FAQs:

1) Explain four principles of WCAG with suitable examples.

- Perceivable: Information must be easy to see or hear.
  Ex: Image description and video captions.
- Operable: Interface must be easy to operate.
  Ex: Keyboard navigation and large buttons.
- Understandable: Content must be easy to understand.
  Ex: Simple language and clear instructions.
- Robust: Content must work with different devices and technologies.
  Ex: Screen reader compatibility.

2) Discuss design considerations for users with visual, hearing, motor and cognitive impairments and explain how interface designed by you supports the special needs of your target users.

- Visual - High contrast, readable text and screen-reader support.
- Hearing - captions and visual alerts.
- motor - large buttons and keyboard navigations.
- cognitive - simple language, clear instructions and consistent layouts.

My interface: The redesigned interfaces use readable text, high contrast, large buttons and simple navigation to make it accessible and user-friendly for target users.
